Abstract

In this paper, following [1, 2, 3, 4, 5, 6, 7] we consider the relations between well-known Fourier transform algorithms.

1 Introduction

A semifast algorithm for a computation is an algorithm that significantly reduces the number of multiplications compared with the natural form of the computation, but does not reduce the number of additions. A semifast Fourier transform in $GF(q)$ is a computational procedure for computing the n -point Fourier transform in $GF(q)$ that uses about $n \log n$ multiplications in $GF(q)$ and about n^2 additions in $GF(q)$ [4].

The n -point Fourier transform over $GF(2^m)$ is defined by

$$F = Wf,$$

$$\begin{pmatrix} F_0 \\ F_1 \\ F_2 \\ \dots \\ F_{n-1} \end{pmatrix} = \begin{bmatrix} \alpha^0 & \alpha^0 & \alpha^0 & \dots & \alpha^0 \\ \alpha^0 & \alpha^1 & \alpha^2 & \dots & \alpha^{n-1} \\ (\alpha^0)^2 & (\alpha^1)^2 & (\alpha^2)^2 & \dots & (\alpha^{n-1})^2 \\ \dots & \dots & \dots & \dots & \dots \\ (\alpha^0)^{n-1} & (\alpha^1)^{n-1} & (\alpha^2)^{n-1} & \dots & (\alpha^{n-1})^{n-1} \end{bmatrix} \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ \dots \\ f_{n-1} \end{pmatrix},$$

where $W = (\alpha^{ij})$, $i, j \in [0, n-1]$, is a Vandermonde matrix, an element $\alpha \in GF(2^m)$ of order $\text{ord}(\alpha) = n \mid 2^m - 1$ is the Fourier transform kernel.

Consider a few well-known Fourier transform algorithms [1, 2, 3, 4, 5, 6, 7] on examples.

The finite field $GF(2^3)$ is defined by an element α , which is a root of the primitive polynomial $x^3 + x + 1$. Cyclotomic cosets modulo 7 over

$GF(2)$ are $(0), (1, 2, 4), (3, 6, 5)$. The binary conjugacy classes of $GF(2^3)$ are $(\alpha^0), (\alpha^1, \alpha^2, \alpha^4), (\alpha^3, \alpha^6, \alpha^5)$. The standard basis of $GF(2^3)$ is $(\alpha^0, \alpha^1, \alpha^2)$. The normal basis of $GF(2^3)$ is $(\beta^1, \beta^2, \beta^4)$, where $\beta = \alpha^3$. Another normal basis of $GF(2^3)$ is the cyclic shift of the previous normal basis: $(\gamma^1, \gamma^2, \gamma^4)$, where $\gamma = \alpha^6$.

Consider the Fourier transform of length $n = 7$ over the field $GF(2^3)$. Let us take the primitive element α as the kernel of the Fourier transform. The

Fourier transform of a polynomial $f(x) = \sum_{i=0}^6 f_i x^i$ consists of components

$$F_i = f(\alpha^i), \quad i \in [0, 6].$$

Thus,

$$\begin{pmatrix} F_0 \\ F_1 \\ F_2 \\ F_3 \\ F_4 \\ F_5 \\ F_6 \end{pmatrix} = \begin{bmatrix} \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 \\ \alpha^0 & \alpha^1 & \alpha^2 & \alpha^3 & \alpha^4 & \alpha^5 & \alpha^6 \\ \alpha^0 & \alpha^2 & \alpha^4 & \alpha^6 & \alpha^1 & \alpha^3 & \alpha^5 \\ \alpha^0 & \alpha^3 & \alpha^6 & \alpha^2 & \alpha^5 & \alpha^1 & \alpha^4 \\ \alpha^0 & \alpha^4 & \alpha^1 & \alpha^5 & \alpha^2 & \alpha^6 & \alpha^3 \\ \alpha^0 & \alpha^5 & \alpha^3 & \alpha^1 & \alpha^6 & \alpha^4 & \alpha^2 \\ \alpha^0 & \alpha^6 & \alpha^5 & \alpha^4 & \alpha^3 & \alpha^2 & \alpha^1 \end{bmatrix} \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \\ f_6 \end{pmatrix}.$$

2 Goertzel's algorithm (1958)

Blahut's modification for finite fields (1983)

The first step of the Goertzel algorithm is a long division $f(x)$ by every minimal polynomial:

$$\begin{aligned} f(x) &= (x+1)q_0(x) + r_{00} \\ f(x) &= (x^3+x+1)q_1(x) + r_1(x), \quad r_1(x) = r_{21}x^2 + r_{11}x + r_{01} \\ f(x) &= (x^3+x^2+1)q_2(x) + r_2(x), \quad r_2(x) = r_{22}x^2 + r_{12}x + r_{02} \end{aligned}$$

where

$$\begin{aligned} r_{00} &= f_0 \\ r_{01} &= f_0 + f_3 + f_5 + f_6 \\ r_{11} &= f_1 + f_3 + f_4 + f_5 \\ r_{21} &= f_2 + f_4 + f_5 + f_6 \\ r_{02} &= f_0 + f_3 + f_4 + f_5 \\ r_{12} &= f_1 + f_4 + f_5 + f_6 \\ r_{22} &= f_2 + f_3 + f_4 + f_6. \end{aligned}$$

The second step of the Goertzel algorithm is an evaluated remainder in every element of the finite field:

$$\begin{aligned}
F_0 &= f(\alpha^0) = r_{00} \\
F_1 &= f(\alpha^1) = r_1(\alpha^1) = r_{21}\alpha^2 + r_{11}\alpha^1 + r_{01} \\
F_2 &= f(\alpha^2) = r_1(\alpha^2) = r_{21}\alpha^4 + r_{11}\alpha^2 + r_{01} \\
F_4 &= f(\alpha^4) = r_1(\alpha^4) = r_{21}\alpha^2 + r_{11}\alpha^4 + r_{01} \\
F_3 &= f(\alpha^3) = r_2(\alpha^3) = r_{22}\alpha^6 + r_{12}\alpha^3 + r_{02} \\
F_6 &= f(\alpha^6) = r_2(\alpha^6) = r_{22}\alpha^5 + r_{12}\alpha^6 + r_{02} \\
F_5 &= f(\alpha^5) = r_2(\alpha^5) = r_{22}\alpha^3 + r_{12}\alpha^5 + r_{02}
\end{aligned}$$

or

$$\begin{pmatrix} F_1 \\ F_2 \\ F_4 \end{pmatrix} = \begin{bmatrix} 1 & \alpha^1 & \alpha^2 \\ 1 & \alpha^2 & \alpha^4 \\ 1 & \alpha^4 & \alpha^2 \end{bmatrix} \begin{pmatrix} r_{01} \\ r_{11} \\ r_{21} \end{pmatrix}, \quad \begin{pmatrix} F_3 \\ F_6 \\ F_5 \end{pmatrix} = \begin{bmatrix} 1 & \alpha^3 & \alpha^6 \\ 1 & \alpha^6 & \alpha^5 \\ 1 & \alpha^5 & \alpha^3 \end{bmatrix} \begin{pmatrix} r_{02} \\ r_{12} \\ r_{22} \end{pmatrix}.$$

Thus,

$$\begin{pmatrix} F_0 \\ F_1 \\ F_2 \\ F_4 \\ F_3 \\ F_6 \\ F_5 \end{pmatrix} = \left[\begin{array}{c|ccc|ccc} \alpha^0 & & & & & & & \\ \hline & \alpha^0 & \alpha^1 & \alpha^2 & & & & \\ & \alpha^0 & \alpha^2 & \alpha^4 & & & & \\ & \alpha^0 & \alpha^4 & \alpha^1 & & & & \\ \hline & & & & \alpha^0 & \alpha^3 & \alpha^6 & \\ & & & & \alpha^0 & \alpha^6 & \alpha^5 & \\ & & & & \alpha^0 & \alpha^5 & \alpha^3 & \end{array} \right] \begin{pmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 0 & 1 & 0 & 1 & 1 \\ 0 & 1 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 & 1 & 1 \\ 1 & 0 & 0 & 1 & 1 & 1 & 0 \\ 0 & 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 0 & 1 & 1 & 1 & 0 & 1 \end{pmatrix} \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \\ f_6 \end{pmatrix}.$$

3 Blahut's algorithm (2008)

We have

$$\begin{aligned}
\begin{pmatrix} F_0 \\ F_1 \\ F_2 \\ F_3 \\ F_4 \\ F_5 \\ F_6 \end{pmatrix} &= \begin{bmatrix} \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 \\ \alpha^0 & \alpha^1 & \alpha^2 & \alpha^3 & \alpha^4 & \alpha^5 & \alpha^6 \\ \alpha^0 & \alpha^2 & \alpha^4 & \alpha^6 & \alpha^1 & \alpha^3 & \alpha^5 \\ \alpha^0 & \alpha^3 & \alpha^6 & \alpha^2 & \alpha^5 & \alpha^1 & \alpha^4 \\ \alpha^0 & \alpha^4 & \alpha^1 & \alpha^5 & \alpha^2 & \alpha^6 & \alpha^3 \\ \alpha^0 & \alpha^5 & \alpha^3 & \alpha^1 & \alpha^6 & \alpha^4 & \alpha^2 \\ \alpha^0 & \alpha^6 & \alpha^5 & \alpha^4 & \alpha^3 & \alpha^2 & \alpha^1 \end{bmatrix} \left[\begin{pmatrix} f_0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix} + \begin{pmatrix} 0 \\ f_1 \\ f_2 \\ 0 \\ f_4 \\ 0 \\ 0 \end{pmatrix} + \begin{pmatrix} 0 \\ 0 \\ 0 \\ f_3 \\ 0 \\ f_5 \\ f_6 \end{pmatrix} \right] = \\
&= \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} (f_0) + \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} \alpha^0 & \alpha^0 & \alpha^0 \\ \alpha^1 & \alpha^2 & \alpha^4 \\ \alpha^2 & \alpha^4 & \alpha^1 \end{bmatrix} \begin{pmatrix} f_1 \\ f_2 \\ f_4 \end{pmatrix} +
\end{aligned}$$

$$+ \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 0 \\ 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} \alpha^0 & \alpha^0 & \alpha^0 \\ \alpha^3 & \alpha^6 & \alpha^5 \\ \alpha^6 & \alpha^5 & \alpha^3 \end{bmatrix} \begin{pmatrix} f_3 \\ f_6 \\ f_5 \end{pmatrix}.$$

4 Fedorenko–Trifonov’s algorithm (2002)

A polynomial $L(x) = \sum_i l_i x^{2^i}$, $l_i \in GF(2^m)$, is called a linearized polynomial. Any polynomial can be decomposed into a sum of linearized polynomials and a free term. A polynomial $f(x) = \sum_{i=0}^6 f_i x^i$ can be represented as

$$\begin{aligned} f(x) &= L_0(x^0) + L_1(x^1) + L_2(x^3) \\ L_0(y) &= f_0 \\ L_1(y) &= f_1 y + f_2 y^2 + f_4 y^4 \\ L_2(y) &= f_3 y + f_6 y^2 + f_5 y^4. \end{aligned}$$

We have

$$\begin{aligned} f(\alpha^0) &= L_0(\alpha^0) + L_1(\alpha^0) + L_2(\alpha^0) \\ f(\alpha^1) &= L_0(\alpha^0) + L_1(\alpha^1) + L_2(\alpha^3) = L_0(1) + L_1(\alpha) + L_2(1) + L_2(\alpha) \\ f(\alpha^2) &= L_0(\alpha^0) + L_1(\alpha^2) + L_2(\alpha^6) = L_0(1) + L_1(\alpha^2) + L_2(1) + L_2(\alpha^2) \\ f(\alpha^3) &= L_0(\alpha^0) + L_1(\alpha^3) + L_2(\alpha^2) = L_0(1) + L_1(1) + L_1(\alpha) + L_2(\alpha^2) \\ f(\alpha^4) &= L_0(\alpha^0) + L_1(\alpha^4) + L_2(\alpha^5) = L_0(1) + L_1(\alpha) + L_1(\alpha^2) + \\ &\quad L_2(1) + L_2(\alpha) + L_2(\alpha^2) \\ f(\alpha^5) &= L_0(\alpha^0) + L_1(\alpha^5) + L_2(\alpha^1) = L_0(1) + L_1(1) + L_1(\alpha) + L_1(\alpha^2) + L_2(\alpha) \\ f(\alpha^6) &= L_0(\alpha^0) + L_1(\alpha^6) + L_2(\alpha^4) = L_0(1) + L_1(1) + L_1(\alpha^2) + L_2(\alpha) + L_2(\alpha^2). \end{aligned}$$

Using $F_i = f(\alpha^i)$, these equations can be represented in a matrix form as

$$\begin{pmatrix} F_0 \\ F_1 \\ F_2 \\ F_3 \\ F_4 \\ F_5 \\ F_6 \end{pmatrix} = \left[\begin{array}{c|ccc|ccc} 1 & 1 & 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 & 0 & 0 & 1 \\ 1 & 0 & 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 0 & 1 & 0 \\ 1 & 1 & 0 & 1 & 0 & 1 & 1 \end{array} \right] \left[\begin{array}{c|ccc|ccc} \alpha^0 & & & & & & & \\ \hline & \alpha^0 & \alpha^0 & \alpha^0 & & & & \\ & \alpha^1 & \alpha^2 & \alpha^4 & & & & \\ & \alpha^2 & \alpha^4 & \alpha^1 & & & & \\ \hline & & & & \alpha^0 & \alpha^0 & \alpha^0 & \\ & & & & \alpha^1 & \alpha^2 & \alpha^4 & \\ & & & & \alpha^2 & \alpha^4 & \alpha^1 & \end{array} \right] \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_4 \\ f_3 \\ f_6 \\ f_5 \end{pmatrix}.$$

5 Trifonov–Fedorenko’s algorithm (2003)

A circulant matrix, or a circulant, is a matrix each row of which is obtained from the preceding row by a left (right) cyclic shift by one position. If entries of a circulant are matrices, the circulant is referred to as a block circulant.

We call a circulant where the first row is a normal basis, a basis circulant.

Let $(\beta^1, \beta^2, \beta^4) = (\alpha^3, \alpha^6, \alpha^5)$ be a normal basis for $GF(2^3)$.

Using

$$\begin{bmatrix} \alpha^0 & \alpha^0 & \alpha^0 \\ \alpha^1 & \alpha^2 & \alpha^4 \\ \alpha^2 & \alpha^4 & \alpha^1 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} \beta^1 & \beta^2 & \beta^4 \\ \beta^2 & \beta^4 & \beta^1 \\ \beta^4 & \beta^1 & \beta^2 \end{bmatrix},$$

we get

$$\begin{pmatrix} F_0 \\ F_1 \\ F_2 \\ F_3 \\ F_4 \\ F_5 \\ F_6 \end{pmatrix} = \left[\begin{array}{c|ccc|ccc} 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 1 & 0 \\ 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 1 & 0 & 1 & 1 \\ 1 & 0 & 1 & 0 & 1 & 1 & 0 \end{array} \right] \left[\begin{array}{c|ccc|ccc} 1 & & & & & & & \\ \hline & \beta^1 & \beta^2 & \beta^4 & & & & \\ & \beta^2 & \beta^4 & \beta^1 & & & & \\ & \beta^4 & \beta^1 & \beta^2 & & & & \\ \hline & & & & \beta^1 & \beta^2 & \beta^4 & \\ & & & & \beta^2 & \beta^4 & \beta^1 & \\ & & & & \beta^4 & \beta^1 & \beta^2 & \end{array} \right] \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_4 \\ f_3 \\ f_6 \\ f_5 \end{pmatrix}.$$

6 Fedorenko’s algorithm (1) (2006)

Combining

$$\begin{bmatrix} \alpha^3 & \alpha^6 & \alpha^5 \\ \alpha^6 & \alpha^5 & \alpha^3 \\ \alpha^5 & \alpha^3 & \alpha^6 \end{bmatrix} = \begin{bmatrix} \beta^1 & \beta^2 & \beta^4 \\ \beta^2 & \beta^4 & \beta^1 \\ \beta^4 & \beta^1 & \beta^2 \end{bmatrix}, \quad \begin{bmatrix} \alpha^1 & \alpha^2 & \alpha^4 \\ \alpha^2 & \alpha^4 & \alpha^1 \\ \alpha^4 & \alpha^1 & \alpha^2 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} \begin{bmatrix} \beta^1 & \beta^2 & \beta^4 \\ \beta^2 & \beta^4 & \beta^1 \\ \beta^4 & \beta^1 & \beta^2 \end{bmatrix},$$

$$\begin{bmatrix} \alpha^2 & \alpha^4 & \alpha^1 \\ \alpha^4 & \alpha^1 & \alpha^2 \\ \alpha^1 & \alpha^2 & \alpha^4 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1 \\ 1 & 1 & 0 \\ 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} \beta^1 & \beta^2 & \beta^4 \\ \beta^2 & \beta^4 & \beta^1 \\ \beta^4 & \beta^1 & \beta^2 \end{bmatrix},$$

we obtain the equivalent Fourier transform

$$\begin{pmatrix} F_0 \\ F_1 \\ F_2 \\ F_4 \\ F_3 \\ F_6 \\ F_5 \end{pmatrix} = \begin{bmatrix} \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 \\ \alpha^0 & \alpha^1 & \alpha^2 & \alpha^4 & \alpha^3 & \alpha^6 & \alpha^5 \\ \alpha^0 & \alpha^2 & \alpha^4 & \alpha^1 & \alpha^6 & \alpha^5 & \alpha^3 \\ \alpha^0 & \alpha^4 & \alpha^1 & \alpha^2 & \alpha^5 & \alpha^3 & \alpha^6 \\ \alpha^0 & \alpha^3 & \alpha^6 & \alpha^5 & \alpha^2 & \alpha^4 & \alpha^1 \\ \alpha^0 & \alpha^6 & \alpha^5 & \alpha^3 & \alpha^4 & \alpha^1 & \alpha^2 \\ \alpha^0 & \alpha^5 & \alpha^3 & \alpha^6 & \alpha^1 & \alpha^2 & \alpha^4 \end{bmatrix} \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_4 \\ f_3 \\ f_6 \\ f_5 \end{pmatrix} =$$

$$= \begin{bmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 1 & 0 \\ 1 & 1 & 1 & 0 & 0 & 0 & 1 \\ 1 & 1 & 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 & 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & & & & & & \\ & \beta^1 & \beta^2 & \beta^4 & & & \\ & \beta^2 & \beta^4 & \beta^1 & & & \\ & \beta^4 & \beta^1 & \beta^2 & & & \\ & & & & \beta^1 & \beta^2 & \beta^4 \\ & & & & \beta^2 & \beta^4 & \beta^1 \\ & & & & \beta^4 & \beta^1 & \beta^2 \end{bmatrix} \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_4 \\ f_3 \\ f_6 \\ f_5 \end{pmatrix}.$$

The equivalent Fourier transform $F_e = W_e f_e$ has the following structure:

$$F_e = W_e f_e = A_e D_e f_e = \begin{bmatrix} A_{11} & \cdots & A_{1l} \\ \cdots & \cdots & \cdots \\ A_{l1} & \cdots & A_{ll} \end{bmatrix} \begin{bmatrix} C_1 & 0 & \cdots & 0 \\ 0 & C_2 & \cdots & 0 \\ \cdots & \cdots & \ddots & \cdots \\ 0 & 0 & \cdots & C_l \end{bmatrix} f_e, \quad (1)$$

where A_e is a binary matrix,

A_e consists of binary circulants A_{ij} ,

D_e is a block diagonal matrix,

D_e consists of basis circulant matrices C_i ,

l is the number of cyclotomic cosets modulo n over $GF(2)$.

7 Fedorenko's algorithm (2) (2006)

Let $(\gamma^1, \gamma^2, \gamma^4) = (\alpha^6, \alpha^5, \alpha^3)$ be a normal basis for $GF(2^3)$.

Combining

$$\begin{bmatrix} \alpha^6 & \alpha^5 & \alpha^3 \\ \alpha^5 & \alpha^3 & \alpha^6 \\ \alpha^3 & \alpha^6 & \alpha^5 \end{bmatrix} = \begin{bmatrix} \gamma^1 & \gamma^2 & \gamma^4 \\ \gamma^2 & \gamma^4 & \gamma^1 \\ \gamma^4 & \gamma^1 & \gamma^2 \end{bmatrix}, \quad \begin{bmatrix} \alpha^1 & \alpha^2 & \alpha^4 \\ \alpha^2 & \alpha^4 & \alpha^1 \\ \alpha^4 & \alpha^1 & \alpha^2 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} \gamma^1 & \gamma^2 & \gamma^4 \\ \gamma^2 & \gamma^4 & \gamma^1 \\ \gamma^4 & \gamma^1 & \gamma^2 \end{bmatrix},$$

we obtain

$$\begin{pmatrix} F_0 \\ F_1 \\ F_2 \\ F_4 \\ F_6 \\ F_5 \\ F_3 \end{pmatrix} = \left[\begin{array}{c|ccc|ccc} \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 & \alpha^0 \\ \hline \alpha^0 & \alpha^1 & \alpha^2 & \alpha^4 & \alpha^6 & \alpha^5 & \alpha^3 \\ \alpha^0 & \alpha^2 & \alpha^4 & \alpha^1 & \alpha^5 & \alpha^3 & \alpha^6 \\ \alpha^0 & \alpha^4 & \alpha^1 & \alpha^2 & \alpha^3 & \alpha^6 & \alpha^5 \\ \hline \alpha^0 & \alpha^6 & \alpha^5 & \alpha^3 & \alpha^1 & \alpha^2 & \alpha^4 \\ \alpha^0 & \alpha^5 & \alpha^3 & \alpha^6 & \alpha^2 & \alpha^4 & \alpha^1 \\ \alpha^0 & \alpha^3 & \alpha^6 & \alpha^5 & \alpha^4 & \alpha^1 & \alpha^2 \end{array} \right] \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_4 \\ f_6 \\ f_5 \\ f_3 \end{pmatrix} =$$

$$= \left[\begin{array}{c|ccc|ccc} 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ \hline 1 & 1 & 1 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 & 1 & 0 \\ 1 & 1 & 0 & 1 & 0 & 0 & 1 \\ \hline 1 & 1 & 0 & 0 & 1 & 1 & 0 \\ 1 & 0 & 1 & 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 1 & 1 & 0 & 1 \end{array} \right] \left[\begin{array}{c|ccc|ccc} 1 & & & & & & \\ \hline & \gamma^1 & \gamma^2 & \gamma^4 & & & \\ & \gamma^2 & \gamma^4 & \gamma^1 & & & \\ & \gamma^4 & \gamma^1 & \gamma^2 & & & \\ \hline & & & & \gamma^1 & \gamma^2 & \gamma^4 \\ & & & & \gamma^2 & \gamma^4 & \gamma^1 \\ & & & & \gamma^4 & \gamma^1 & \gamma^2 \end{array} \right] \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_4 \\ f_6 \\ f_5 \\ f_3 \end{pmatrix}.$$

Note that the binary matrix A_e for this algorithm in (1) consists of binary circulants and block circulants.

8 Complexity

The Fourier transform algorithms [5, 6, 7] of length $n = 2^m - 1$ over $GF(2^m)$ take two stages:

1. The first stage is calculation of l m -point cyclic convolutions;
2. The second stage is multiplying the binary matrix A_e by the vector $D_e f_e$.

The complexity of the first stage is about $n \log n$ multiplications and additions over elements of $GF(2^m)$. The complexity of the second stage is $N_{add} < 2n^2 / \log n$ additions over elements of $GF(2^m)$ [8].
